

JOVAN KALYANGO

Quantitative Researcher / Quant Developer

Bologna, Italy (CET) · +39 349 433 3088 · kalyangojonn@gmail.com · jovan-portfolio-chi.vercel.app · linkedin.com/in/jovan-kalyango · github.com/KalyangoJovan

PROFILE

MSc in Statistical Sciences (University of Bologna & Utrecht University) with 4+ years building production data systems on Google Cloud, and founder of an independent systematic trading operation — researched, backtested, and automated end to end. My method is specification-first: trading rules written as explicit, numbered specifications before any code, implemented in a Python backtesting engine, validated in-sample, then confirmed out-of-sample on a held-out year before capital moves. Seeking a quantitative research or quant developer seat where statistical rigour and the ability to ship production systems both count.

PROFESSIONAL EXPERIENCE

Founder — Driips Capital (systematic trading research)

Remote · 2025 – Present

Independent quantitative research and automated execution — index futures, FX, CFDs

- Designed and specified rule-based intraday strategies (time-of-day session effects, stop-run reversion, cross-asset lead-lag confirmation) as explicit numbered specifications before implementation.
- Built the full research stack in Python: 1-minute historical data ingestion, vectorised backtesting engine, trade-level P&L attribution in risk units, drawdown and distribution analysis.
- Enforced out-of-sample discipline: strategies developed on in-sample data and confirmed on a fully held-out year before deployment; documented assumptions, costs, and lookahead-bias checks.
- Automated the live loop end to end: signal generation, broker execution bridge, and an auto-journaling service that reconciled 222 trades over 12 months into a reporting cockpit with a complete audit trail.
- Designed the risk framework: pre-trade limits, per-day loss caps, and kill-switch conditions.
- Public research release: github.com/KalyangoJovan/driips-backtester — specification, engine, reproducible notebook, and out-of-sample results (231 trades, +277R net on a held-out year) with costs and limitations stated.

Data Engineer — Bitbang Srl

Bologna, Italy · June 2022 – Present

Digital analytics consultancy serving enterprise clients

- Build and operate streaming and batch pipelines on GCP: Pub/Sub ingestion, Apache Beam (Python) on Dataflow, BigQuery modelling with advanced SQL (window functions, MERGE, partitioning) — production systems where correctness and latency matter.
- Root-cause pipeline anomalies and document fixes for audit — the same reconciliation mindset applied at Driips.

Founder & Engineer — Rubikon (therubikon.org)

Remote · 2025 – Present

Production assessment SaaS — evidence of shipping complete systems solo

- Built and operate a live multi-tenant platform (Next.js, PostgreSQL) serving a government ministry programme for 652 officers — data pipelines, analytics, automated reporting, zero-downtime production migrations.

EDUCATION

MSc, Statistical Sciences (Data Science)

University of Bologna & Utrecht University

BSc, Statistical Sciences (Maths & Stats)

University of Bologna

Includes study periods at UC Berkeley and the University of Glasgow.

TECHNICAL SKILLS

Quant & statistics: Probability & statistics, hypothesis testing, time-series analysis, backtesting methodology, risk-unit P&L attribution, out-of-sample validation

Programming: Python (pandas, NumPy) · SQL (BigQuery, PostgreSQL) · TypeScript · Git

Systems: GCP (BigQuery, Dataflow, Pub/Sub) · streaming & batch pipelines · broker API integration · production deployment

Languages (spoken): English (fluent) · Italian (professional working proficiency)
